

INDUSTRIAL INSTALLATION

In addition to our extensive fabricating capabilities, August Winter & Sons also has a proven track record in successful field installations. Examples shown here reflect our great diversity in industries served, including some of the most demanding and challenging installations found anywhere. Your toughest assignment will be supported by our licensed engineers who can perform on-site analysis and structural tests including roof loads and expansion calculations, steel strength, wind shear, and more. Your confidence is ensured with our quality-driven service, our precision craftsmanship, and our on-time completion.

After fabricating this foundry dust collection system, August Winter installed the entire project on site. This engineered system included 36" diameter ductwork, multiple bag houses, secondary filtration systems, and structural erection.

As conventional ground cranes could not reach the location for this 450,000 CFM air handling system atop a large paper mill, August Winter undertook one of the largest helicopter industrial projects in the state. All ductwork was laid out by our CAD department, then laser-measured, insulated and clad prior to installation. Two air handling systems — nearly 90 percent of all ductwork — were set in place by helicopter. The heaviest section weighed about 24,000 lbs. The entire project was a turnkey operation under the direction of August Winter, including all gas piping and electrical work.

August Winter served as construction manager and installation contractor for this power plant coal dust removal system. Work included all structural engineering, concrete work, electrical, roofing and building enclosure. The three-stories-tall system consisted of 12 bag houses with 4,800 bags and a steam-driven turbine fan.

Some projects demand fast response and proven capabilities, like this one. August Winter & Sons had field crews on site within hours after the customer called about a problem with two large stacks. A plan was then developed to fabricate the 1/2"-thick, 10' diameter stack sections at our shop while crews removed the old stacks and prepared for the new installation. As a result, the repair work was completed in record time.

Tank projects take on all shapes and sizes, often fabricated in sections for ease and accessibility of field installations. The stainless steel tank project (at left) was delivered in 5 sections. The tank size was 22' in diameter and 65' tall. The tank structures (at right) were installed in just 3 days after which only final welding remained.

Industrial fabrication and installation have long been a specialty of August Winter & Sons. These projects, like most industrial ductwork, were prefabricated from our CAD engineered drawings and then installed on site. With our design/build services, you'll partner with both our licensed engineers and proven craftsmen who handle it all.
